

# Lattice-based cryptography: security foundations and constructions

Adeline Langlois

EPFL, Lausanne, Switzerland

# Cryptography

## New challenges in cryptography

- ▶ Need of new functionalities,
- ▶ Quantum computers.

## Lattice-based cryptography

- ▶ Is it a credible alternative to modern cryptography?
  - ▶ **Functionality**
  - ▶ **Security**
  - ▶ **Efficiency**
- ▶ Study of the new functionalities:
  - ▶ Fully homomorphic encryption,
  - ▶ Cryptographic multilinear maps.

# Lattice

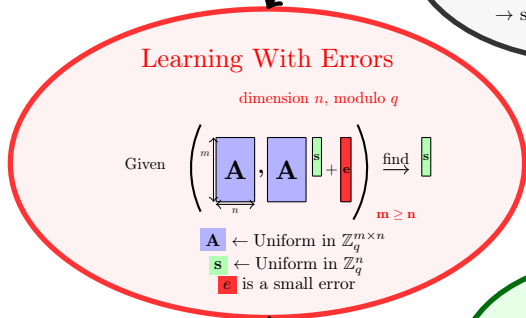

# Lattice

Shortest Vector Problem

# Security Foundations

# Constructions

# Lattice-based cryptography

## Advantages

- ▶ (Asymptotically) efficient;
- ▶ Most security proofs **from the hardness of lattice problems**;
- ▶ Likely to resist attacks from quantum computers.

## From basic to very advanced primitives

- ▶ Public key encryption and signature scheme (practical) ...
- ▶ **New functionalities**
  - ▶ Fully homomorphic encryption,
  - ▶ Cryptographic multilinear maps and applications.

# My results

Classical hardness  
of LWE

## Learning With Errors

dimension  $n$ , modulo  $q$

Given  $\left( \begin{array}{c} \text{matrix } \mathbf{A} \\ \text{matrix } \mathbf{A} \\ \text{vector } \mathbf{s} \\ \text{vector } \mathbf{e} \end{array} \right) \xrightarrow{\text{find}} \text{vector } \mathbf{s}$

$m \geq n$

The diagram shows a matrix  $\mathbf{A}$  with dimensions  $m$  (rows) and  $n$  (columns). It is followed by another matrix  $\mathbf{A}$ , a vector  $\mathbf{s}$ , and a vector  $\mathbf{e}$ . The expression is  $\mathbf{A}\mathbf{s} + \mathbf{e}$ . An arrow labeled "find" points to a vector  $\mathbf{s}$ .

and/or  
SIS

$\mathbf{A} \leftarrow$  Uniform in  $\mathbb{Z}_q^{m \times n}$   
 $\mathbf{s} \leftarrow$  Uniform in  $\mathbb{Z}_q^n$   
 $\mathbf{e}$  is a small error

Improving cryptographic  
multilinear maps

Construction of  
group signatures

# Diffie-Hellman Key Exchange (1976)

$\mathbb{Z}_q = \mathbb{Z}/q\mathbb{Z}$  with  $q$  prime,  $g$  public generator of  $\mathbb{Z}_q^*$ .

Agreed secret key:  $K = g^{x_1 x_2} = y_1^{x_2} = y_2^{x_1}$

- **Security:** Decisional Diffie-Hellman problem.

# Cryptographic Multilinear Maps – 21st Century variant

Group of  $N > 2$  parties want to communicate privately via cloud.

Secret key (using  $e$ : "cryptographic multilinear map"):

$$\begin{aligned} K &= e(g, \dots, g)^{x_1 \cdots x_N} \\ &= e(y_2, y_3, \dots, y_N)^{x_1} \\ &= e(y_1, y_3, \dots, y_N)^{x_2} \end{aligned}$$

# Cryptographic Multilinear Maps

- ▶ 2013: [Garg, Gentry, Halevi 13]
  - ▶ First plausible realization for  $N > 3$ , via ideal lattices,
- ▶ 2014: GGHLite – More efficient variant of GGH,  
[Langlois, Stehlé, Steinfeld 14]
- ▶ Improving and implementing GGHLite – *work in progress*.  
[Albrecht, Cocis, Laguillaumie, Langlois]

$N$	$n$	$\log q$	Setup	Publish	KeyGen	params
7	65536	3605	2457s	12.58s	6.03s	112.7MB
26	262144	15410	29407s	465.36s	530.27s	1.4GB

- ▶ Open problems 
  - ▶ Construction with a security proof?
    - ▶ Efficient for large  $N$ ?
